Regulation of stem cell fate in mammalian epidermis

Speaker: **Fiona Watt**

Centre for Stem Cells and Regenerative Medicine Director
King's College London

Date: **23/06/2017- 12:30h**

Place: Sal3n de Actos CIPF

Abstract: The epidermis is maintained by multiple, spatially distinct, stem cell populations whose progeny differentiate along the lineages of the interfollicular epidermis, hair follicles, sebaceous glands and sweat glands. In my talk I will present evidence that injury-induced plasticity is not an exclusive property of stem cells but is also a characteristic of terminally differentiated epidermal cells.
